

1      **ABSTRACT**

2      A design tool includes a service definition model to enable abstract  
3      description of distributed computing systems and distributed applications. The  
4      design tool also includes a schema to dictate how functional operations within the  
5      service definition model are to be specified. The functional operations include  
6      design of distributed applications, deployment of distributed applications, and  
7      management of distributed applications.
